

Don't guess where to open. Ask the map.

An AI-assisted WebGIS for retail and F&B
site selection around Jakarta transit.

Pick the wrong spot and it is your capital that burns.

The blocks around stations are the busiest trading ground in Jakarta, and people still pick a location on instinct.

Nobody counted how busy it is

Everyone knows the blocks around a station are busy. Nobody knows which blocks.

The competition is invisible

Opening a coffee shop on a street already full of them is a way to lose money.

The space is never counted

A good area with nothing to rent is not an opportunity.

Busy is not spread evenly.

Some streets around a station are full of trade and some are quiet, and from the pavement they look the same. SpotOn counts the difference, so the choice does not have to be a guess.

Find an area that is busy, still thin on your kind of rival, and has somewhere to rent.

How busy it is

The shops and cafés already trading around a spot are the surest sign that people come past. That is what SpotOn counts first.

Who is already there

The businesses of your own kind within a short walk. A street full of them is a street with less room for one more.

Whether there is space

Premises actually on the market. A good area with nothing to take is not an opportunity, however busy it looks.

How well it is connected

The stations and stops within a walk, with a train station counting for more than a bus stop.

One score per area, per kind of business.

Each area gets a score out of 100 for the business you have in mind, a label that says what kind of place it is, and the reasons behind both.

- Underserved
- Competitive
- Saturated
- Busy, little space

Jakarta, in areas you can walk across.

Every hexagon is a small area with a station or a stop within a short walk. Each one is counted and scored on its own, never from a city average.

562

walkable areas around transit

1,105

stations and stops of the MRT, KRL, LRT and TransJakarta

24,630

businesses on the map, of 13 kinds

Every hexagon at its real place, with the four transit networks in their own colours.

Three kinds of evidence, all of it real.

Real places, counted one by one. Where nothing has been counted yet, the map says so instead of guessing.

THE CITY AS MAPPED

Stations, streets and shops

The stations and stops of all four transit networks, the businesses along the streets, and the hours they say they are open, from OpenStreetMap.

MAPID'S CATALOGUE

Businesses and premises

Businesses of every kind across Jakarta, each with its name, and the premises currently on the market with their asking prices.

PEOPLE ON THE STREET

Field notes

Receipts, menus and shopfronts recorded by surveyors who went there, with photographs. Shown beside an area as notes, never mixed into its score.

Where nobody has counted, nothing is claimed.

Areas the catalogue has not covered yet are drawn hatched and left unscored. They are never filled in with an estimate, and never quietly dropped from a ranking.

● areas that have been counted ▨ not surveyed yet

What the score is made of.

One score per area, per kind of business, out of 100. Every part of it is something that was counted.

- 1

Start with how busy the area is.

The trade already standing within a walk, other than your own kind.
- 2

Take away the competition.

The more of your kind already there, the smaller the gap left for you.
- 3

Check there is somewhere to rent.

An area with nothing on the market drops to the bottom, however busy it is.
- 4

Weigh the transit and the price.

More stations within a walk count for more. Dearer space counts against, a little.

ONE AREA, ONE BUSINESS

Rawa Selatan
for a coffee shop

65 out of 100
Underserved, the highest of all areas

How busy it is 96 of 100, higher than 99% of areas

Coffee shops already here 5

Stations and stops within a walk 4

Premises on the market 12

Worked out by SpotOn from the counted data, exactly as it is in the app.

Ask in plain language, and the map changes.

Say what you want to open and the whole city recolours for that business. No formula to fill in and no jargon to memorise.

Meet Tapak, your guide.

Tapak reads your question, works out what to look up, and answers with the reasons attached, in Indonesian or English.

The numbers are counted, never invented.

Tapak writes the sentence. Every figure in it comes from the map's own counting, and one that does not is thrown out before you see it.

It says when it cannot tell.

A question the data cannot answer gets an honest answer, not a confident guess.

Good morning. I'm Tapak. I've been round 562 cells near the MRT, KRL, LRT and TransJakarta corridors. What are you thinking of opening?

Coffee shop

Drinks & dessert

Bakery

Warung & rice shop

Fast food outlet

Noodles & meatballs

Seafood restaurant

Foreign cuisine restaurant

Minimarket

Grocery store

Laundry

Repair shop

Pharmacy

Coffee shop

Now counting it up from my notes ...

Tapak greets by the time of day, offers the kinds of business the map can score, and paces while it looks the answer up.

Act one. One question, where the eye already is.

- Nothing to fill in.**
No menus, no sliders, no tables. A greeting, one question, and a box that takes anything you type.
- Examples show the way.**
They type themselves into the box and clear again, and the same four sit under it as buttons, so nobody has to type to get started.
- Or just open the map.**
The city behind the box is already coloured by how busy each area is. Looking around is always free.

Act two. Ask, and the whole city recolours.

The question becomes a conversation.

The box moves to the side and the map takes over. Every area the answer names is marked, and tapping one opens it.

You see what was understood.

Before answering, the map shows what it understood. If it picked something up wrong, you see it immediately.

Places, with scores out of 100.

Rawa Selatan leads at 65. Each place can be opened to see why.

Follow-up questions work.

Why that one, which ones to avoid, any rent. Tapak remembers what was just said.

Rawa Selatan

65

● Underserved

the highest of all areas

Ask Tapak about this area

WHAT THE SCORE IS MADE OF

Coffee shop

How busy it is
higher than 99% of areas

96

Coffee shops already here

5

Other businesses nearby

273

Premises on the market

12

WHAT THIS AREA REACHES

4 stations and stops within a short walk

4 TransJakarta stops. The area's transit access is fair.

COST OF SPACE

Rp 40.2m per m² of land · 12 units on the market

Dearer than 40% of the areas with a known price.

WHEN THIS AREA IS OPEN

Too few businesses here publish their opening hours to show how the day goes.

FIELD NOTES

1 note from people who went there, with photographs.

Tap an area, and see what it is made of.

Everything about one place.

How busy it is, who is already trading there, the stations and stops it reaches, what space costs, when the street is open, and what people recorded on the ground.

Every figure is set in context.

A score on its own means little. The card says where each figure stands against every other area, so a good number reads as good.

Ask Tapak about it.

One tap puts the area into the conversation, and the next question you type is read about that place.

Any area can be seen as a model.

Its buildings, streets and stops are read off the same basemap, cut to the walking range, and can be turned by hand. Each building stands at the height the map records.

Setiabudi Astra, the business district.

The same area the front page shows, chosen because its towers show what the model can do.

Built from the map itself.

Buildings, streets, water and parks come straight from the map, and every building stands at its recorded height. Nothing is drawn that the map does not have.

Turn it, and move through the day.

Drag to turn the model. Slide the hour, and the doors that are open at that time light up, from the hours each business publishes.

Setiabudi Astra

● the middle of the area ● stations and stops ■ coffee shops ◆ premises on the market

○ field notes ● doors open at 10a on a Monday

Setiabudi Astra, everything within 800 m of the point in the middle, built from OpenStreetMap data, CARTO cartography.

Honest by design.

A recommendation is only worth following if you can trust where its numbers came from. Four promises hold that up, everywhere in SpotOn.

1 **No invented numbers.** Every figure on screen was counted from real data. Tapak can phrase an answer, but it cannot make a number up.

3 **It says what it does not know.** A question the data cannot answer gets a plain answer to that effect, never a confident guess.

2 **Missing is not zero.** An area nobody has surveyed is shown as unknown, not as empty, and is left out of a ranking rather than ranked as quiet.

4 **Reasons attached.** Every score can be taken apart to see what it is made of, and every claim points back to something that was counted.

One map, all kinds of decision.

From a first warung to a chain's next ten branches. Free to try, and looking at the map is never charged for.

WHO ASKS

- Retail & F&B investors
- Small businesses on a tight budget
- First-time owners
- Expansion teams
- Property owners & agents
- Site finders

THE BUSINESS TYPES SCORED

- Coffee shop
- Drinks & dessert
- Bakery
- Warung & rice shop
- Fast food outlet
- Noodles & meatballs
- Seafood restaurant
- Foreign cuisine restaurant
- Minimarket
- Grocery store
- Laundry
- Repair shop
- Pharmacy

FREE

Free, no card needed

Enough to try it. Ask two or three things, then open the places the answers name. 5 questions and 15 areas a week.

PERSONAL

Rp 79,000 a month

For one person working through a shortlist, with the room to open everything that comes back. 60 questions and 300 areas a week.

PREMIER

Rp 249,000 a month

For a team, or for one person surveying the whole grid inside a week. 250 questions and 1,500 areas a week.

Six minutes, from the front page to a shortlist.

- 1 Open the front page and scroll one block.**
The street model walks through a whole day as the page scrolls. **Say:** busy is something you can count.
- 3 Tap “Coffee shop”, then “Only where the rent is cheap”.**
The whole city recolours and the top three arrive. **Say:** the map shows how it understood you before it answers.
- 5 Tap the top area and walk the card.**
How busy, who is here, how to get here, what space costs, when the street opens, what people noted. **Say:** every figure says where it stands against the rest of the city.

- What to show, and the one sentence to say at each step. Nothing on screen is staged: every figure is worked out live from the data.
- 2 Sign in with one tap and meet Tapak.**
Tapak greets by the time of day and asks the one question that matters. **Say:** what do you want to open?
 - 4 Ask “Why Rawa Selatan?”**
Typed or tapped. The answer comes back with its reasons. **Say:** Tapak wrote the sentence, the counting wrote every number.
 - 6 Open the model, turn it, slide the hour.**
The place itself, built from the map, with its doors lighting up. **Say:** this is where you would actually be standing.

Nothing to set up The demo sign-in is one button, and the map keeps working even without an AI key or a database, so nothing can stop the demo on the day.

A map that answers, not one that just displays.
